MORE THAN 10 YEARS OF EXPERIENCE

OVER 12 000 PROSTHETIC DENTAL WORKS

MORE THAN 4500 ORAL SURGICAL  
PROCEDURES

MORE THAN 5000 HAPPY PATIENTS

# SURGERY

Oral surgery is dental medicine specialty whose most important procedures are: complex wisdom tooth extraction, impacted or retained canine removal, apicoectomy, residual tooth root removal, sinus lift. Oral surgery includes implantology, reconstruction of esthetic and functional oral cavity deformities performing different procedures that precede implantology and prosthetics.

Combined with other dental medicine specialities, sometimes it is necessary to perform some of the surgical procedures so that the therapy is successful and complete.

All of the procedures are performed under the local anesthesia and therefore they are completely painless!

## SINUS LIFT

Sometimes, there is not enough bone height for implants to be placed. In that case a sinus lift surgery is performed. A sinus lift can be done only in the upper jaw. This simple procedure consists of lifting or moving upwards your sinus membrane. The process itself, although it may sound complicated and painful, is extremely simple and is performed under the local anesthesia and therefore is completely painless.

## ALVEOLECTOMY

This procedure refers to extracting a part of the tooth or impacted or retained tooth that can be placed deep in your bone. It is often associated to wisdom tooth removal. Part of the tooth or an impacted tooth is removed through the opening in the bone, the incisions are then closed up using sutures. The procedure itself, although it may sound complicated and painful, is extremely simple and is performed under the local anesthesia and therefore is completely painless

## APICOECTOMY

When there is an inflammatory process at the end of your root tip and it can not be solved by a root canal procedure or, when the root canal treatment is performed well, but the process is still present, the surgical removal of your root tip will be necessary. The procedure itself, although it may sound complicated and painful, is extremely simple and is performed under the local anesthesia and therefore is completely painless.

## ALL ON FOUR

It is a revolutionary technology that enables the patient to obtain new teeth in 24 hours only. It is necessary to place 4 implants and immediately load them with the immediate denture. The final prosthetic work is delivered after 6 months. The procedure is performed under the local anesthesia and it is completely painless.

HIGHLIGHTS FROM OUR OFFER

# PRGF TECHNOLOGY

In order to obtain the best results possible in all of our surgical procedures we use the PRGF technology, patented by BTI.

Regenerative medicine is aiming to utilize the resources of one's own body with the aim of tissue regeneration and recovery of damaged functions.

Due to its great results in treatment and shorter healing period a number of public figures as well as a number of athletes turned to Endoret® technology with the purpose of better injury recovering or operation recovering.

What is Endoret (PRGF) technology?

It is biomedical technology that from the minimal amount of the patient's blood isolates and concentrates the growth factor and other proteins responsible for tissue healing and regeneration. Application of Endoret® technology stimulates, accelerates and helps the recovery of the damaged tissue.

Endoret® is the most advanced autologous system used to obtain plasma rich in platelets. It is safe to use and its efficiency in stimulation and acceleration of tissue regeneration has been confirmed in over hundred of published works in the magazines all over the world. It has also been presented in many national and international medical congresses.

Therapeutic formulations

The wide application maximizes therapeutic possibilities of this biomedical technology and provides adjusted clinical solutions

HIGHLIGHTS FROM OUR OFFER

# IMPLANTOLOGY

Dental implant is a small titanium screw that can be placed in your bone in order to replace the root of the missing tooth. The implant is completed with the abutment (lately, ceramic abutments are widely spread) that is used as an attachment between the implant and the prosthetic work. Its purpose is to replace the missing tooth root or to support dental bridges if there are more teeth missing. Completely toothless patients often have problems with their dentures. In those cases, dental implants can be used to anchor the dentures and therefore having a denture, especially the one in the lower jaw is much safer and the experience is far more pleasant since eating is not a problem anymore. Dental Masnić's first choice are top quality implants Astra Tech and Straumann that offer longterm warranty, Also, here you can find Mis implants.

# ESTETHICS

The concept of esthetic has been changing over the course of time, in general and in dentistry. Dentistry's primary concern was healing and functionality rehabilitation of damaged tissue.. today more than ever the patients are concerned about the esthetic aspect that dentistry has to offer. Therefore, our goal, other than removing pain and tissue rehabilitation is ensuring you have the best esthetic solution possible. We pay attention to the new materials used to imitate the natural tooth. The desire to bring the imitation of natural tooth to perfection has inspired us to develop esthetic dentistry of highest standards. Our duty is not only to fix your teeth but to fix your smile. Smile design requires the newest technology that meets the highest standards of our clients.

# DIGITAL SMILE DESIGN

Each smile is one of a kind, unique and personal. To achieve this when creating a smile we use Digital Smile design technology.

Smile design is the perfect means of communication between the patient and the dentist, the expectations are met by using all the medical and technological possibilities. The procedure of designing the new smile consists of taking photos of the current situation of the patient's mouth; then the analysis of esthetic parameters is digitally conducted. Based on these parameters one or more simulations of your final smile are made. Thanks to this innovative technology patient, prior to any intervention, can visualize how certain changes will affect the smile esthetic and the harmony of the smile with the rest of the face.

By using this method, misunderstandings and dissatisfaction by the final prosthetic solution are avoided.

Simple smile design became an irreplaceable step in planning dental prosthetic solutions.

DESIGN YOUR SMILE WITH US!

HIGHLIGHTS FROM OUR OFFER

## CERAMIC CROWNS AND VENEERS

Crowns and veneers are prosthetic solutions that can resolve not only your malfunctions but they can also improve your esthetic appearance. Self confidence and the quality of life brought to you by your new smile have no price.

## WHITENING

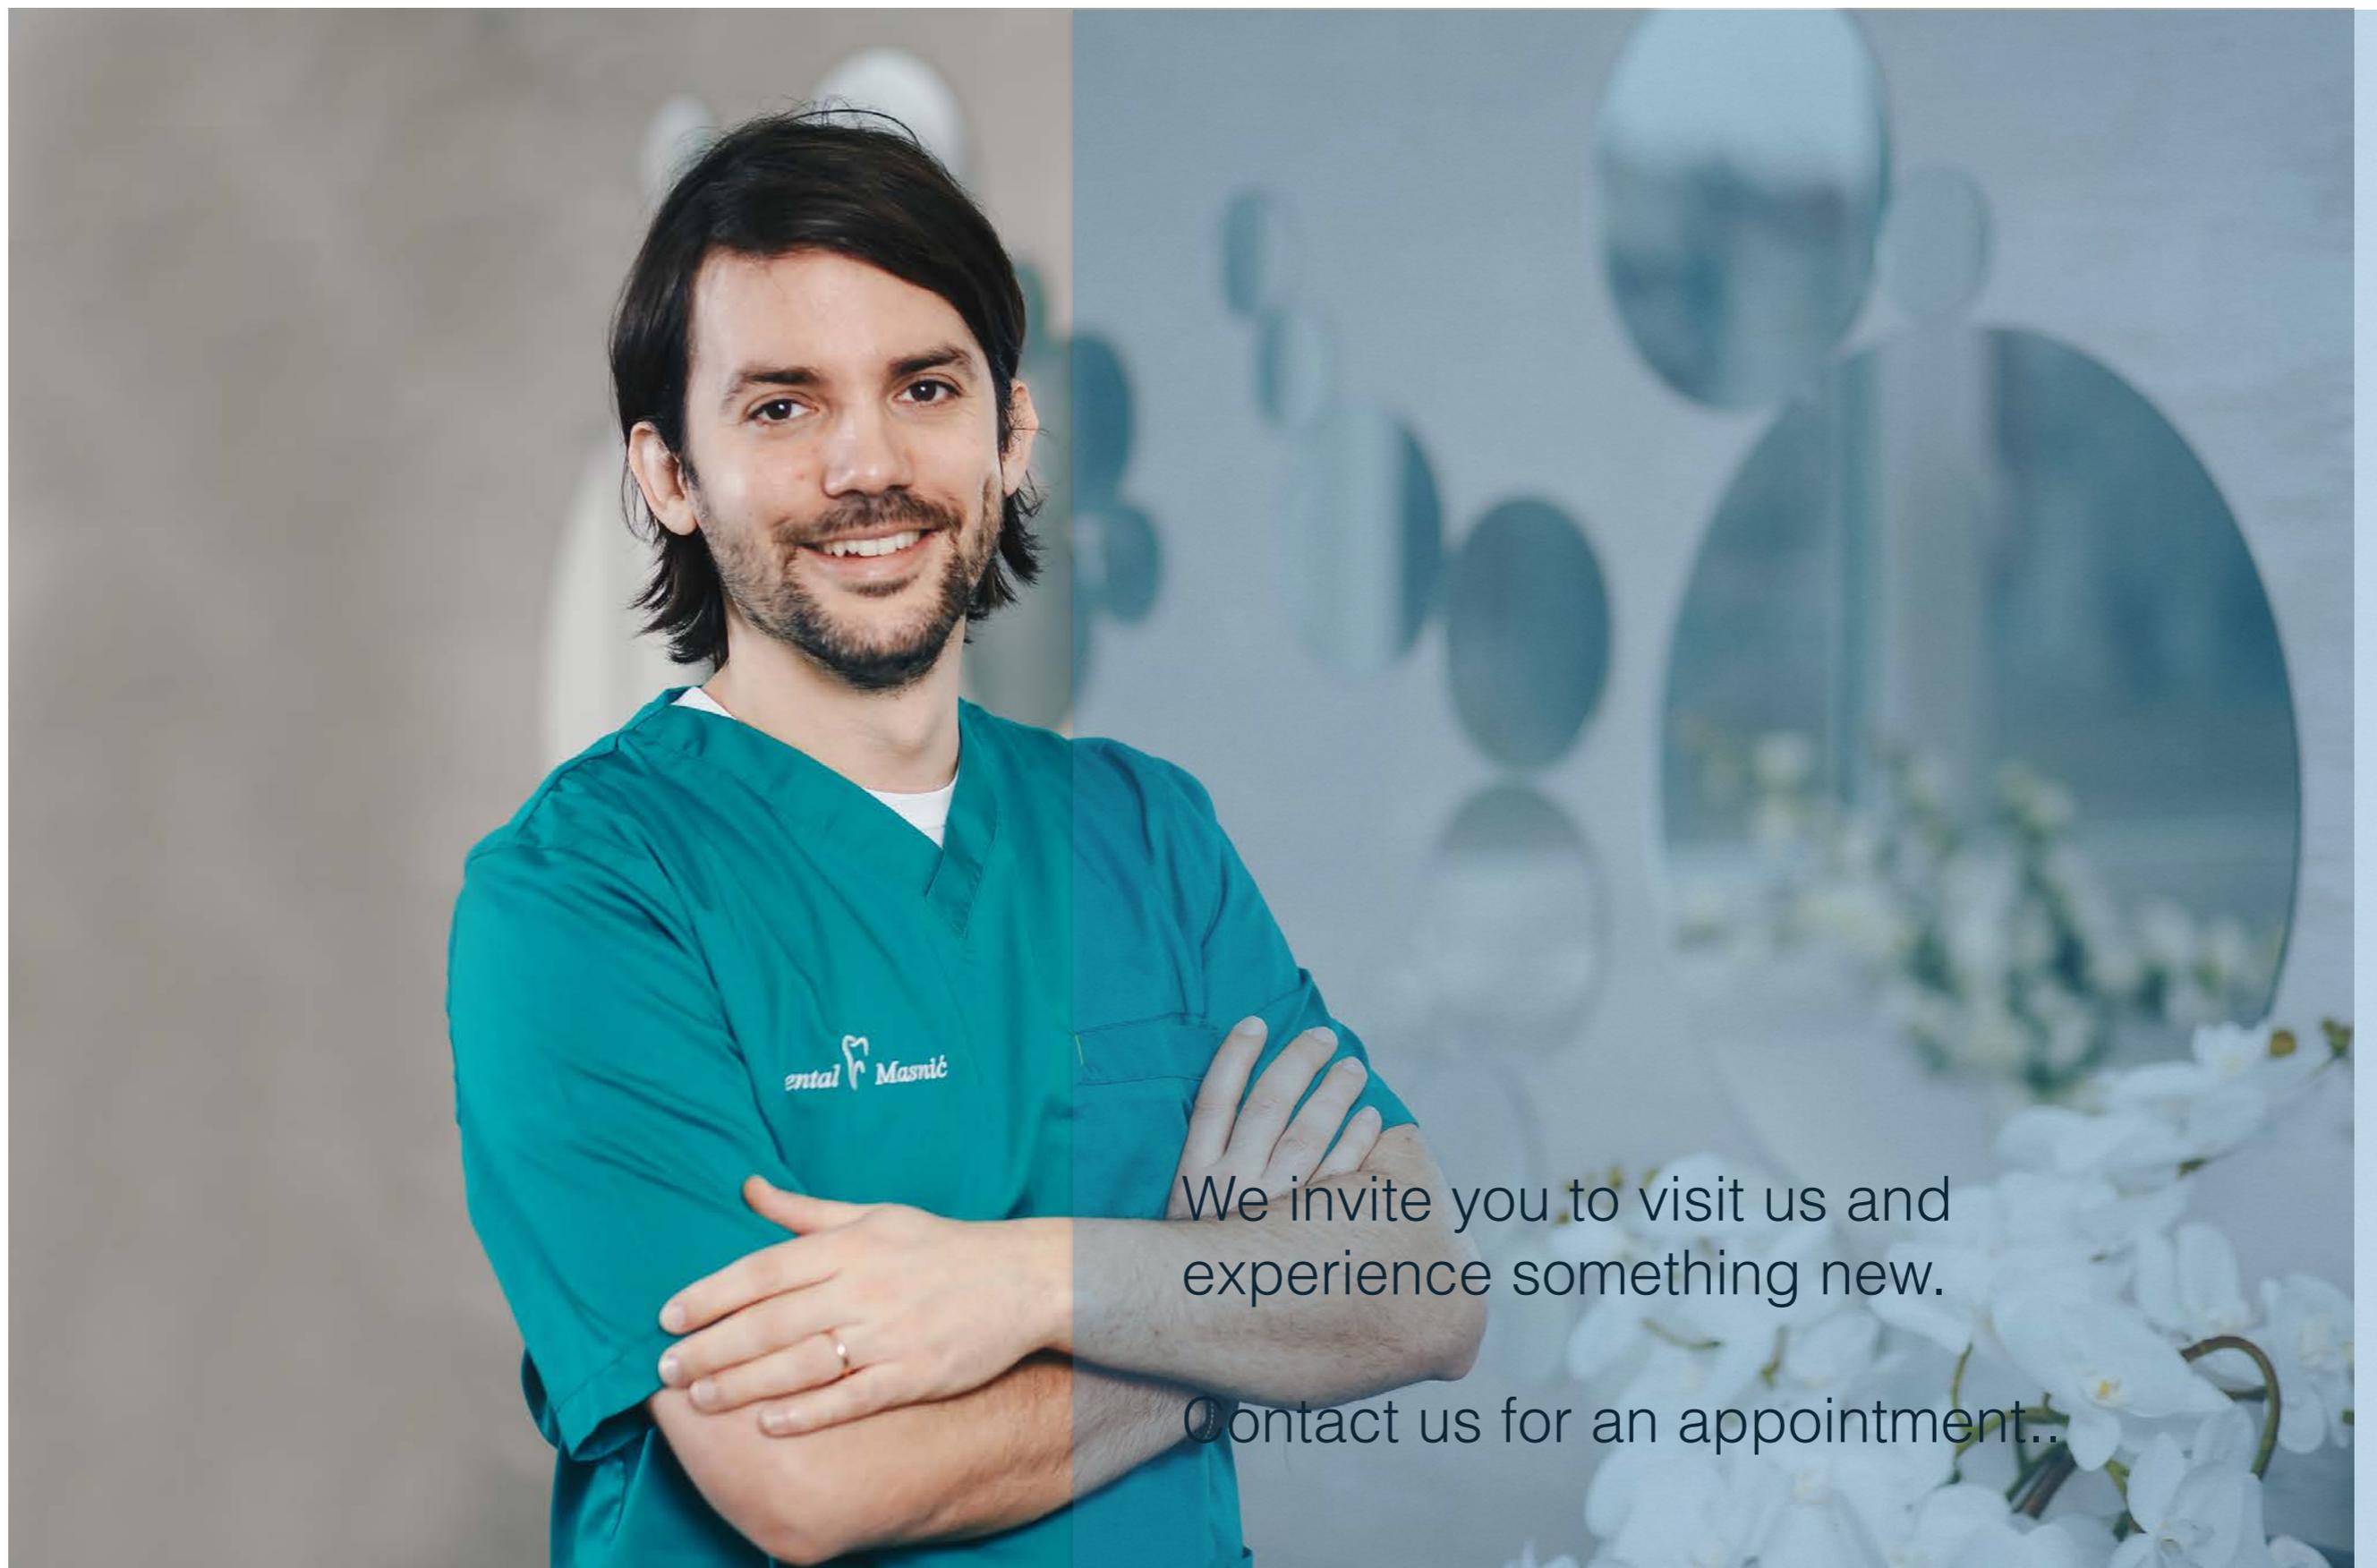

Often patients are not happy with the color of their teeth. Whitening can bring out your naturally beautiful smile. Philips ZOOM technology can help you to achieve great results, by using gentle, minimally invasive approach that won't damage your tooth tissue.

HIGHLIGHTS FROM OUR OFFER

# DENTAL MASNIĆ

Luka Masnić, Doctor of Dental Medicine and his team want to wish you a welcome at Dental Masnić Studio. Dental Masnić is a modern studio where you will feel comfortable and have a completely new experience at the dentist's. The studio is equipped with modern technology that enables us to offer you excellence - individual approach, professional patient care and high quality service. We continue to invest in our education and professional growth, new equipment and materials.
